

Pótvarázsló

Gál Levente and Siroki Péter

The summary of our Project “PótVarázsló”

The “PótVarázsló” project introduces a unique digital platform designed for car owners and mechanics in Hungary. Its primary aim is to create a community-based solution that helps vehicle owners get help from professional mechanics if they have a problem with their vehicle. The platform serves as a bridge between everyday drivers and experienced car mechanics, making car maintenance more accessible and transparent. Mechanics can create their own profiles, post their video or documents and availability. Customers can view their posts which builds trust and help others make informed decisions. The platform is a forum where mechanics can post and help non-mechanic, share experiences, or seek advice from professionals and other car owners.

What makes this platform special is its focus on community and trust. Instead of relying on large corporations or impersonal directories, PótVarázsló relies on peer feedback and direct communication. It also includes educational content and blog posts to help car owners better understand their vehicles and the repair process. In the future, the developers plan to introduce new features such as, real-time chat, and push notifications for posts. There may also be a mobile application to make the service more convenient for users on the go. By building a helpful and supportive user community, the platform can become a regular maintenance forum. Overall, PótVarázsló offers a modern and practical solution for everyday car troubles. It empowers users by giving them more control over their repair choices and helps build lasting connections between drivers and local mechanics. With its focus on user experience, transparency, and innovation, it has the potential to transform how people deal with car problems in Hungary and beyond.
